Enterprise Governance, Data Minimization, and Consent Policy

1. Ephemeral Processing and Storage Isolation:

DocuPilot processes user documents strictly in memory during active sessions. Uploaded files, parsed sections, and intermediate representations are held within isolated memory structures bounded by session thread identifiers. No raw document contents are written to permanent disks or committed to version control.

2. Zero Retention Guarantee:

Upon session termination or manual session deletion (via `DELETE /api/document-assistant/session/{thread_id}`), all associated document chunks, metadata, and memory allocations are permanently erased. Application restarts automatically purge all in-memory state.

3. Explicit Consent Requirement:

External AI processing and OCR extraction strictly require explicit, affirmative user consent (via `external_processing_consent=true`) before any page image or extracted text is transmitted to external providers (Azure Document Intelligence, Google Cloud Document AI, OpenAI, Gemini). Requests without explicit consent are rejected with HTTP 400.

4. Session Purge and Data Erasure:

Users retain full control to immediately purge their session data. The session cleanup mechanism atomically removes conversational message histories, query cache records, and vectorized document chunks.

5. Telemetry and Audit Logs:

Application logs record request timestamps, stage latency metrics, and anonymized evaluation scores. Document text, identity numbers (Aadhaar, PAN, Passport), and financial details are explicitly scrubbed and never persisted to system logs.
